engine - what is the normal operating temperature ...

Conductive heat transfer is proportional to the temperature difference between materials. If engine metal is at 250 °C and the air is at 20 °C, then there is a 230 °C temperature difference for cooling. An air-cooled engine uses all of this difference.

Internal combustion engine cooling - Wikipedia

The larger the temperature difference between the hot and cold sections of a Stirling engine, the greater the engine's efficiency. The heat sink is typically the environment the engine operates in, at ambient temperature.

Stirling engine - Wikipedia

What type of engine temperature sensor should be used? There are two main types of temperature sensor used on automotive engines: Negative temperature coefficient (NTC): This type of sensor works in such a way that the internal electrical resistance decreases as it is exposed to more heat.
