The reconstruction of digital geometric models of physical objects, usually indicated as Reverse Engineering (RE) in the Computer Aided Design (CAD) field, has been extensively studied in recent years, due to the development and spreading of 3D scanning technologies and the increase in number of potential applications (Burstion et al., 2014, Solaberrieta et al., 2014, Voicu et al., 2013).

The diagram below shows the most important functional blocks of the ARM chip.[2] The actual processing happens in the bottom half of the chip, which implements the data path. The chip operates on 32 bits at a time so it is structured as 32 horizontal layers: bit 31 at the top, down to bit 0 at the bottom.
