Advantages of a liquid / water cooled engine: Very effective on multi-cylinder engines. Effectively controls the engine's temperature. Improves engine's thermal efficiency & prevents overheating. A closed system reduces loss of water due to evaporation. Suitable in most climatic conditions with use of the coolant.

What Is A Liquid Cooled / Water Cooled Engine ...

Instead of fins used to keep the engine cool, in water-cooled engines the engine block and heads are cast solid but with internal passages throughout the engine block around the cylinders and over the cylinder in the cylinder head. The engine will utilize a water pump that is connected to these passages on the engine.

Internal combustion engine cooling. Water has a higher heat capacity than air, and can thus move heat more quickly away from the engine, but a radiator and pumping system add weight, complexity, and cost. Higher-power engines generate more waste heat, but can move more weight, meaning they are generally water-cooled.

A water-cooled cooling system. A pump, driven by a pulley and belt from the crankshaft, drives hot coolant out of the engine to the radiator, which is a form of heat exchanger. Unwanted heat is passed from the radiator into the air stream, and the cooled liquid then returns to an inlet at the bottom of the block and flows back into the channels again.
