Marine Engine Room Ventilation. When a boat is under power, the engine can create an amazing amount of heat – so it's important to ensure the marine engine room ventilation system is doing its job.

**Marine Engine Room Ventilation | Fisheries Supply**

Engine room heat doesn't just affect engines, it also damages other equipment such as generators, cooling, and electrical systems. Engine room fans. Engine room ventilation systems consist of both intake fans, which insert combustion air and cooling air, and exhaust fans, which pull out cooling air only.

In the old days, many marine engine cooling systems were of the “raw-water” variety, meaning simply that they relied on pumping whatever water the boat was floating in through the engine and pumping it out the exhaust system—salt water, polluted water, algae-infested water, whatever was

available.

Our AC or DC high volume fans are perfect for the purpose of assisting in the induction of air into and around your engine room.. Combustion engines require air to produce horsepower, to support combustion, and for cooling purposes. In a traditional marine engine room with natural aspiration (ie: no fans), the only air movement is due to the air being consumed to support combustion.

Our little boat has been fitted with an engine bay fan since she was new back in 1979. I've discovered from reading the original paperwork that it was an optional extra specced by the first owner. The fan is one of those blower jobbies that sucks air out of the engine bay and out through a vent on the topsides. However, it only comes on when I manually switch it on.

Most marine engines have a radiator, but it's usually called a heat exchanger. It works exactly the same as an air-cooled car radiator, the exception being that it is water flowing over the fins rather than air. Water is a much better heat conductor, and if you are floating in it, it's the only logical fluid to use.
