BS3 and BS4 engines have basic functioning same. If I say what has changed is the emission CO and NOx. Quantity of NOx emitted is now reduced to half in BS4 norms. Now this reduction in gases how does it effects engines is basically we put more higher catalyst in the silencer also called as muffler to curb the amount of CO and NOx emitted.

Hence, a BS4 engine has to follow a more stringent emission rule compared to BS3 engine. This helps in reducing air pollution in India. As for how does it work, it works like any other engine but with slightly different design considerations that will help achieve lower emissions.

BS4 engines emit less Carbon dioxide, Carbon Monoxide and Less soot (particulate matter) than BS3 engines. All new cars that are being sold in 13 major cities in India (including metros) must have BS4 engines. Remaining cities can have both BS3 and BS4 engines.

Barat stage emission standards {BSES} are emission standards instituted by the Government of India to regulate the output of air pollutants from internal combustion engines and Spark-ignition engines equipment, including motor vehicles. The standards and the timeline for implementation are set by the Central Pollution Control Board under the Ministry of Environment & Forests and climate change.

BS-III engines were introduced in 2005 and with the introduction of BS-IV in 2014, they were already outdated by nine years. The biggest change between a BS-III and BS-IV engine is the exhaust system. BS-IV engines need bigger catalytic converters (bikes might be more curvy than size zero, fingers crossed) to nullify harmful nitrogen-based gases.
