gle-rate system, the sample spacing in a multirate system can vary from point to point [1], [2]. This often results in more efficient processing of signals because the sampling rates at various internal points can be kept as small as possible. Unfortunately, thisalso results in the introduction of a new

Vaidyanathan's book is a very concise, yet enjoyable book on multirate systems and filter banks. Multirate systems and Filter banks represent some of the state-of-the-art research even today, and I'm a strong proponent of introducing the basic concepts as early as possible, even in the first DSP course.

synthesis-analysis system is used, as shown in Figure 2. This system is also called a transmultiplexer. In this system, all the  $M$  signals are interpolated by a factor of  $M$  and filtered by  $M$  synthesis filters  $F_k(z)$  for  $k = 0, 1, \dots, M-1$ . Then, the outputs are added to give a single signal with sampling rate being  $M$  times that of the input signals.
