the compiler will typically optimize the access to flag completely away, since its code path analysis shows that nothing inside the loop could change the value of flag anyway. To tell the compiler that this variable could be changed outside the scope of its code path analysis (e. g. from within an interrupt routine), the variable needs to be declared like:

avr-libc: Frequently Asked Questions - CCRMA

Use of the SLEEP instruction can allow an application to reduce its power consumption considerably. AVR devices can be put into different sleep modes. Refer to the datasheet for the details relating to the device you are using. There are several macros provided in this header file to actually put the device into sleep mode.

avr-libc

The GNU linker avr-ld cannot handle binary data directly. However, there's a companion tool called avr-objcopy. This is already known from the output side: it's used to extract the contents of the linked ELF file into an Intel Hex load file. avr-objcopy can create a relocatable object file from arbitrary binary input, like

avr-libc: Frequently Asked Questions - eit.lth.se

This header file declares the interface to some simple library routines suitable for handling the data EEPROM contained in the AVR microcontrollers. The implementation uses a simple polled mode interface.
